

# How to restart the JBoss manually on Max OSX

Sometimes it is necessary to restart the JBoss, e.g. if the server log file shows a lot of unexplained error messages, and especially if they are related to memory shortage. Here is how to perform this operation:

- Make sure that no user is working with GECAMed anymore and all clients are closed.
- On the server machine, open a Terminal shell.
- cd to the following directory «GECAMed Install Dir»/jboss-4.0.5.GA/bin/  
By default, the «GECAMed Install Dir» is /Applications/GECAMed
- Type the following shell command:  
**% sudo ./jboss\_ctl.sh stop**  
This stops the JBoss server.
- To restart JBoss, type  
**% sudo ./jboss\_ctl.sh start**

The first time **sudo** will prompt for a password.
